# 1. Summary

The purpose of this specifications document is to provide both the reporting entities and reporting persons with the requirements and conditions for creating compatible XML files using the provided XML- Schema for the different supported report types.

A report file contains the following information which can be represented in the goAML Client after uploading and verifying the XML file.

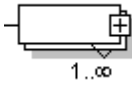

- Basic information about the report.
- Where does the money come from.
- Who conducted the transaction.
- Where does the money go to.
- Was the transaction related to a property transfer
- Who reported the transaction(s) (Optional)
- What was the reason for the report and which actions have been taken (Optional)
- In multi-party transactions, list of all involved parties and their respective roles in the transactions.

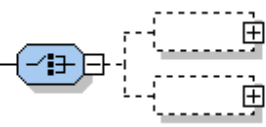

An XML report is linked to one Reporting Entity but may contain multiple transactions. An uploaded report can be from ONE report type.

This document will provide a reference to the schema, nodes and types as well as the lookup tables for enumeration values. (e.g. Country Codes)

# 2. Conventions used in this document

#### Bi-Party Transaction

One of the nodes *t\_from\_my\_client* or *t\_to\_my\_client* should be provided unless the involved parties are Correspondent Banks. This will be mandatory starting May 12<sup>th</sup> 2020

Table 4: Details node transaction

### 3.41 Node t\_from\_my\_client

This node should be provided if the source side of the transaction is a client of the reporting bank. As of schema 4.0, entity could be a direct party in bi-party transactions.

### 3.42 Node t\_from

Source of the transaction. Can be either a person, an account or an entity. As per schema 4.0, the entity could be a direct party in bi-party transactions

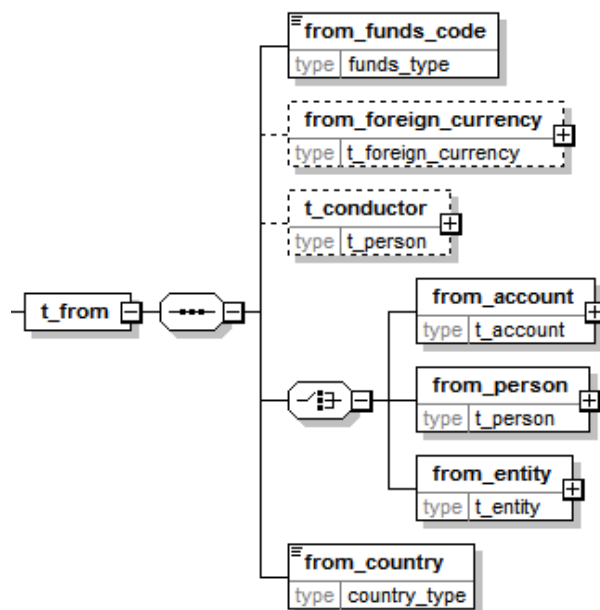

Figure 6: Overview node t\_from

Note: Bi-directional transactions are composed of a source and destination. The source and destination may be either a person, an account or an entity (As per schema 4.0). For account deposits, the source is a person and the destination is an account i.e. on t\_from side we will have from\_person and on the t\_to side we will have t\_to\_account. For account withdrawals, we will have from\_account at the t\_from side and to\_person at the t\_to side. For money remittances, we will have person to person transactions i.e. from\_person at the t\_from side and to\_person at the t\_to side. The same structure of person to person transactions can be used for any money service type of transaction. For account transfers, we will have account to account transactions i.e., from\_account at the t\_from side and to\_account at the t\_to side.
